*1) batch file*

*A batch file or batch job is a collection, or list, of commands that are processed in sequence often without requiring user input or intervention.*

*With a computer running a Microsoft operating system such as Windows, a batch file is stored as a file with a .bat file extension.*

*Other operating systems may define a batch job in a shell script, containing a list of commands to be*

*executed one after the other.*

*Batch files are often used to help load programs, run multiple processes at a time, and perform common or repetitive tasks.*

*For example, a batch job could be used to back up files, process log files, run a series of calculations or diagnostics, or any other job that require multiple commands to run. A batch job can accomplish multiple tasks without interaction from the*

*user, freeing up the user's time for other tasks.*

*Thank you*
